# Evaluating State School Finance Systems

Indicators of School Funding Equity and Adequacy

# Goals of School Finance Systems

- The goal of state school finance systems is to provide all children, regardless of where they live or attend school, ***equal opportunity to achieve common, adequate outcome goals***
- Providing equal educational opportunity toward common goals costs different amounts in different settings, and across children (individually and collectively) by needs and contexts
  - State accountability systems (for whatever they're worth) set common goals... rate, rank and evaluate schools (and children) on whether they meet those goals
  - A fair system requires funding sufficient to provide equal opportunity to meet these goals (which are often used for articulating constitutional rights).

# Modeling “progressivity” vs. “adequacy”

- **Progressivity**

- Expenditure regression of “what is” in terms of current distribution of expenditures, with respect to “poverty” controlling for other factors that strongly influence expenditure variation:

$$\text{Spending} = f([\text{Poverty, Disability, ELL}][\text{Scale, Sparsity}][\text{Input Prices}])$$

- **Equal Opportunity (& Adequacy)**

- Expenditure regression (as “cost function”) holding “outcomes” constant, and controlling for factors that influence “efficiency” of spending
- That is, what levels of spending are associated with achieving a given outcome target (“what should be”), given average efficiency characteristics, controlling for a variety of factors that influence costs

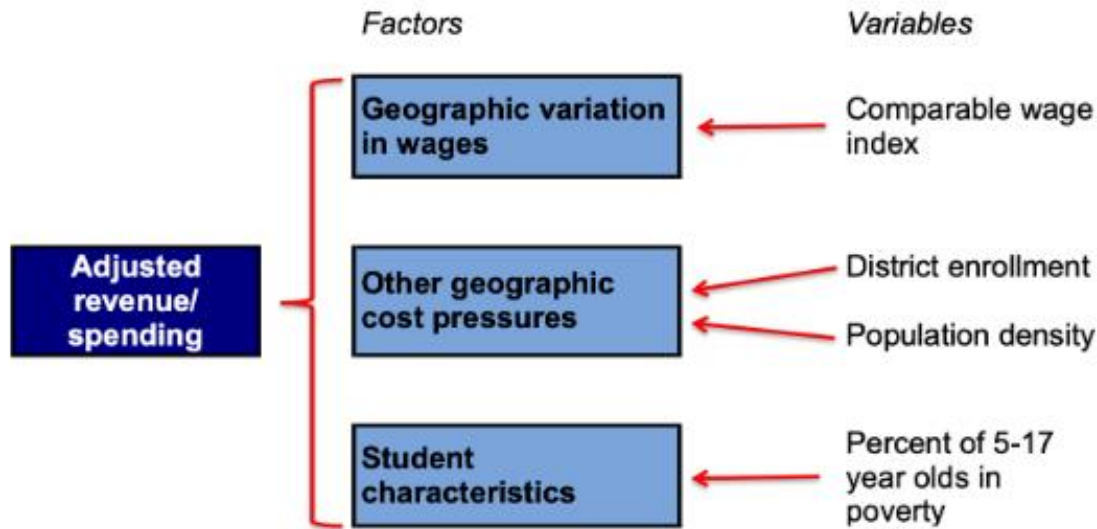

$$\text{Spending} = f(\text{OUTCOMES} [\text{Poverty, Disability, ELL}][\text{Scale, Sparsity}][\text{Input Prices}] \text{INEFFICIENCY})$$

- How does actual spending compare to these predictions for each district?

# Modeling Differences in Spending & Cost

***Q: How much spending is needed, controlling for need and cost factors (and inefficiency), to achieve specific outcome goals?***

# Progressiveness vs. Adequacy

(SFID, Urban Institute & Ed Trust)

# Progressiveness vs. Adequacy

# Unifying concepts & methods

## Conceptual Goal:

To provide, through school funding formulas, resources sufficient for all students to have **equal opportunity** to achieve (constitutionally) **adequate outcomes**

## Empirical Goal (requirements):

Methods used to guide policy, both setting of funding levels and cost differentials, must validly link spending requirements with outcome measures (& expectations).

## Legal Causes of Action:

1. EP (State or Fed) exists where similarly situated individuals are differently treated.  
Treatment = Outcome Expectation(s)\*  
(under which all are similarly situated)
2. "Adequacy" (state) requires linking spending levels to outcome expectations

*\*antiquated conceptions of "horizontal" and "vertical" equity undermine (negate) this argument!*

# Selecting measures of “student needs” as “cost” factors

- We identify and select certain measures of student population characteristics because they are predictive of yielding lower outcomes on the measures of interest.\*
  - The goal is to design a funding formula that supports equal opportunity to achieve common outcomes.
- It is important to identify that version of the measure that most accurately predicts – across the full range – variation outcomes.
  - Many ways to measure variations in shares of children from low income families across schools or districts. FRL in high poverty settings may not pick up variation well (if most/all schools are near or above 80%)
  - It’s not about making sure we measure each kid that qualifies or doesn’t but rather that we best capture the variation across schools & districts that is predictive of outcome variation.
- Then, use those same measures in cost modeling to predict cost variation
  - The goal is to leverage financial resources to mitigate the risk!
  - And when it comes to policy design, don’t mix and match weight recommendations and population measures.

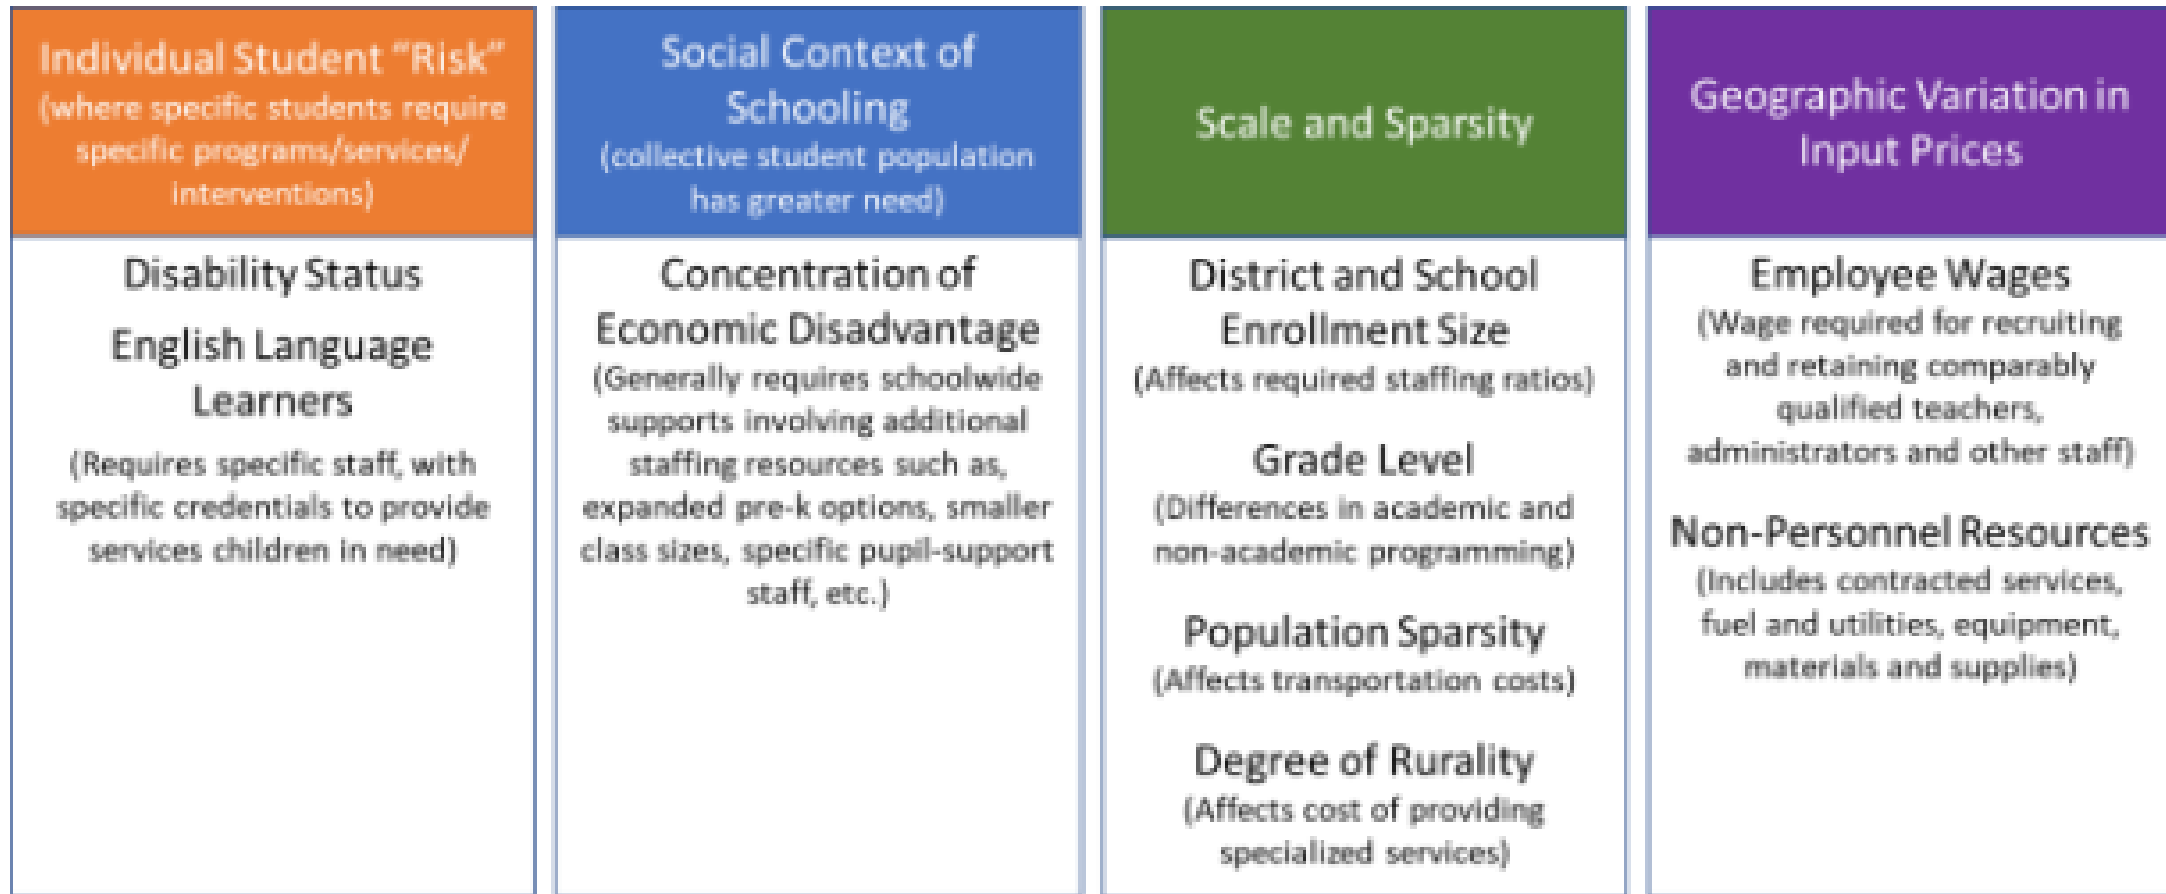

Risk Analysis

Cost Modeling

Formula  
Simulation

# From related work in Vermont (2018)

Figure 2.1. Factors Affecting the Costs of Achieving Common Outcome Goals

Note: Cost is the spending required, less inefficiency, to achieve any specific set of outcome goals

# Tech Tips

Standardizing Methods & Models for Evaluating  
Spending or Revenue Variation

# Use consistent approaches for inter & intra district spending modeling

- District Modeling

- Spending =  $f$ (Poverty, ELL, Disability\*, Grade Range Shares, Scale, Sparsity, Input Prices)

- School Level Modeling (if within district)

- Spending =  $f$ (Poverty, ELL, Disability\*, Grade Range Shares, ~~Scale, Sparsity, Input Prices~~)

\*ideally broken out into a) high incidence/low cost & b) low incidence/high cost

# Similar methods should be used for within & between district modeling

## Across New York State Districts

DV = Current Spending per Pupil	Coef.	Std. Err.
<b>Student Needs</b>		
% Poverty (Census)	<b>-\$11,783</b>	<b>\$1,876</b>
% ELL	\$8,938	\$2,864
% Special Education	\$16,365	\$4,272
<b>Competitive Wage Variation</b>		
	\$9,081	\$987
<b>Population Density</b>		
<100	\$21,779	\$15,164
101 to 300	-\$1,337	\$5,284
201 to 600	\$563	\$4,626
601 to 1200	-\$1,617	\$1,989
1201 to 1500	-\$418	\$2,443
1501 to 2000	-\$3,679	\$1,946
Unified K-12 District	\$368	\$944
<b>Interaction with Population Density</b>		
<100	\$1,620	\$2,886
101 to 300	\$3,044	\$1,147
201 to 600	\$742	\$1,028
601 to 1200	\$688	\$378
1201 to 1500	\$296	\$424
1501 to 2000	\$868	\$317
Constant	\$5,349	\$1,445
R-squared =	0.4538	

Spending across districts is highly regressive with respect to child poverty rates!

Spending is not very predictable as a function of rational factors (or in the “right” direction)

## Within New York City

	Coef.(Difference)	Std. Err.
<b>Grade Level</b>		
% in Grades 6-8	-\$779	\$163
% in Grades 9-12	-\$757	\$142
<b>Student Need</b>		
% Subsidized Lunch	<b>\$2,008</b>	<b>\$297</b>
% Special Education	<b>\$25,159</b>	<b>\$1,174</b>
School Size (ln of Enrollment)	-\$2,635	\$85
Constant	\$34,319	\$653
Adj R-squared =		<b>0.6148</b>

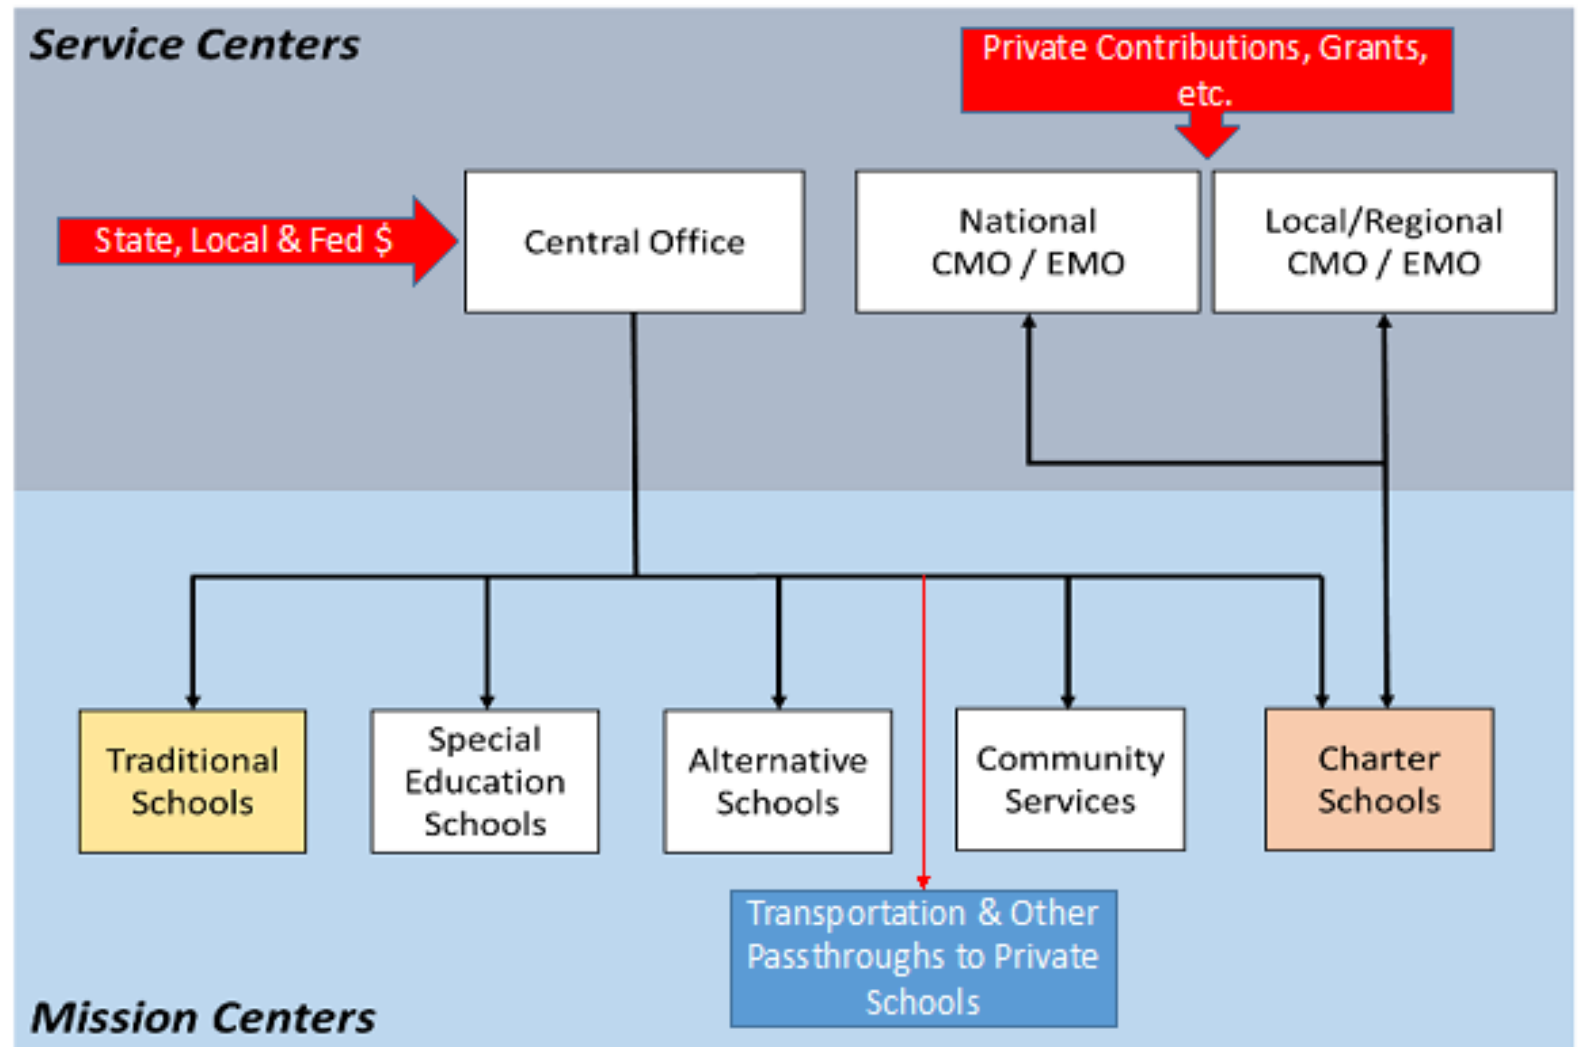

Spending across schools is progressive with respect to low income shares!

Spending is predictable as a function of rational factors (and in the “right” direction)

In school level analysis, make sure to isolate comparable scope of services and match numerator (resources spent/allocated) and denominator (students served)

This is also an issue when calculating district resources!

1. As states increase shares of children in charter schools, they reduce effort to fund schools more generally
2. **As the student population becomes more black & brown, white adults reduce their effort to fund schools**
3. More liberal states apply higher effort, and as states become more liberal, they increase their effort.

# Adequacy and Outcomes

Findings from Ongoing Work

**RESEARCH BRIEF**

## THE ADEQUACY OF SCHOOL DISTRICT SPENDING IN THE U.S.

Bruce D. Baker  
Matthew Di Carlo  
Mark Weber  
March 2021

**ABSTRACT**

We present an overview of spending adequacy among individual K-12 school districts in the U.S. Our results are from a new database of over 12,000 public school districts that allows users to compare each district's actual per-pupil spending levels to estimates of adequate spending levels—i.e., spending required to achieve the common goal of national average math and reading scores. The data are for the 2017-18 school year. Predictably, we find substantial heterogeneity, with many districts spending well above our estimated adequacy targets and many others spending well below, in some cases shockingly below. Districts with negative (i.e., inadequate) funding gaps are especially prevalent in the southeast and southwest, but they are also found throughout the entire U.S., including in states, such as Massachusetts and Connecticut, which include generally high-spending districts. The sum of these negative gaps across all districts (ignoring districts with positive gaps) is \$104 billion, and the average negative gap is \$4,254 per-pupil. Conversely, even in states whose underfunding is widespread and typically severe, there are numerous districts in which resources exceed our adequate spending estimates. Finally, we show that the extent of funding inadequacy increases with district child poverty rates and with the proportion of Black and especially Hispanic (Latinx) students served by districts. These results illustrate that most states are failing in their job of filling the hole between district costs and their capacity to pay those costs, as well as how, even in states that are more successful, many districts slip through the cracks. An effort to rectify these discrepancies could consist of a strategic expansion of the federal role in education finance, as well as a reevaluation of how states fund their schools. High-quality district adequacy measures can help guide this process by identifying whose resources are needed most.

## PANELISTS

### **Bruce D. Baker**

Professor, Department of Educational Theory, Policy, and Administration, Rutgers University Graduate School of Education

### **Preston Green III**

Professor of Educational Leadership and Law and the John and Maria Neag Professor of Urban Education at the Neag School, University of Connecticut

### **Ericka Weathers**

Assistant Professor of Education, Department of Educational Policy Studies, Penn State University

### **Fedrick Ingram (moderator)**

Secretary-Treasurer, Albert Shanker Institute and American Federation of Teachers

# Racial Causes Require Race-Based Remedies

## Race-Based Causes – Past & Present

- FHA Discrimination → HOLC Redlining
  - Restrictive Covenants & HoAs
  - Block Busting
  - Mortgage Lending Discrimination
  - Steering (renting or buying)
  - School District Boundary Gerrymandering
- 
- **RACISM / DISCRIMINATION / SEGREGATION WAS/IS THE CAUSE OF THE ECONOMIC DISPARITIES!**
  - **RACE TARGETED REMEDIES ARE THE SOLUTION!**

# Addressing the Educational Damages of Racial Isolation

- Preston C. Green II.; Bruce D. Baker; Joseph O. Oluwole, "School Finance, Race, and Reparations," *Washington and Lee Journal of Civil Rights and Social Justice* 27, no. 2 (Spring 2021): 483-558
- Baker, B. D. (2011). Exploring the sensitivity of education costs to racial composition of schools and race-neutral alternative measures: A cost function application to Missouri. *Peabody Journal of Education*, 86(1), 58-83.

# Racial isolation is a “cost” factor which must be compensated in state school finance formulas

This isn't “deficit thinking” it's “reparations thinking”

Baltimore City Cost Model Estimates

# Data & Tools for School Finance Research, Exploration & Teaching

School Finance Indicators Database & Reports

# Using our data and resources

- The purpose of this project is to inform and improve school finance debates and policymaking in the U.S.
- All our resources are designed to be used by all stakeholders, regardless of their finance or research backgrounds
- Our state and district datasets are free to download for yourself, along with user-friendly documentation
  - These datasets (and accompanying documentation) include many measures not discussed in this presentation, such as teacher salary competitiveness, staffing ratios, etc.
- But we also have many resources that you can use without analyzing the data yourself, and everything is available at the SFID website:

[schoolfinancedata.org](https://schoolfinancedata.org)

# Resources: getting started guide

## GETTING STARTED WITH THE SCHOOL FINANCE INDICATORS DATABASE

The **School Finance Indicators Database** (SFID) is a collection of resources on K-12 school funding compiled and published by researchers at the Albert Shanker Institute and Rutgers University Graduate School of Education. SFID products are specifically designed to be easy to use for policymakers, educators, journalists, advocates, parents, and other stakeholders.

This short guide will help you get started.

### A quick introduction to the SFID

School finance is incredibly important. But finance research can be a challenge. Every year, federal, state, and local governments collect reams of finance data, which feed an endless supply of papers and reports from academics and organizations, often reaching conflicting conclusions. The purpose of the SFID is to cut through this clutter by giving you what you need to evaluate and compare state and district finance systems with rigorous but accessible measures.

But the SFID isn't just a compilation of simple data all thrown into a spreadsheet. Our measures, while easy to understand and interpret, are calculated using sophisticated methods and over a dozen different data sources.

The key idea behind our approach is the fact that comparing funding measures within and between states requires accounting for differences in context. For instance, comparing raw per-pupil spending between Massachusetts and Alabama doesn't tell you much about whether spending is "high" or "low" in either place, since these are two very different states serving two very different student populations. And the same point applies for comparisons *within states*: you can't compare spending in New York City with spending in suburban or rural upstate New York districts without accounting for the differences between these districts.

### Our 3 guiding principles

1. Proper funding is a necessary condition for educational success (money matters).
2. The cost of education varies by context, and resources should be targeted at students who need them most (equity).
3. The adequacy and fairness of school funding are largely a result of policy choices (good policy → good outcomes).

**NEW!** Check out our short “**Getting Started with the SFID**” guide, which includes:

- Descriptions of the datasets and resources, including many variables not discussed today
- A catalog of all data visualizations
- Walk-through example of how to download and use our datasets (in Excel)

This guide was uploaded to this session's resources and is also available on the SFID website

ABSTRACT

We present an overview of spending adequacy among individual K-12 school districts in the U.S. Our results are from a new resource, the District Cost Database (DCD), which allows users to compare districts' actual per-pupil spending levels to estimates of the levels required to achieve a common “benchmark” goal (national average test scores) for roughly 12,000 U.S. public school districts in 2018. Predictably, we find substantial heterogeneity, with many districts spending well above our estimated adequacy targets and many others spending well below, in some cases quite shockingly below. Districts with negative (i.e., inadequate) funding gaps are especially prevalent in the southeast and southwest, but they are also found throughout the entire U.S., including in states, such as Massachusetts and Connecticut, which include generally high-spending districts. Conversely, even in states where inadequate funding is the norm, there are districts in which resources exceed our cost estimates. Finally, we show that the size of negative funding gaps increases with district child poverty rates and with the proportion of Black and especially Hispanic students served by the districts. These results illustrate that most states are falling in their job of filling the holes between districts' costs and their capacity to pay those costs, as well as how, even in states that are more successful, many districts slip through the cracks. The sum of these negative gaps across all U.S. districts (ignoring districts with positive gaps) is \$104 billion. An effort to rectify these discrepancies could consist of a strategic expansion of the federal role in education finance, as well as a recalibration of how states fund their schools. Our district adequacy measures can help guide this process by identifying where resources are needed most.

Research Brief 02-2021 [www.schoolfinancedata.org](http://www.schoolfinancedata.org)

## RESEARCH BRIEFS

Occasional analyses of different measures not included in the annual report or profiles.

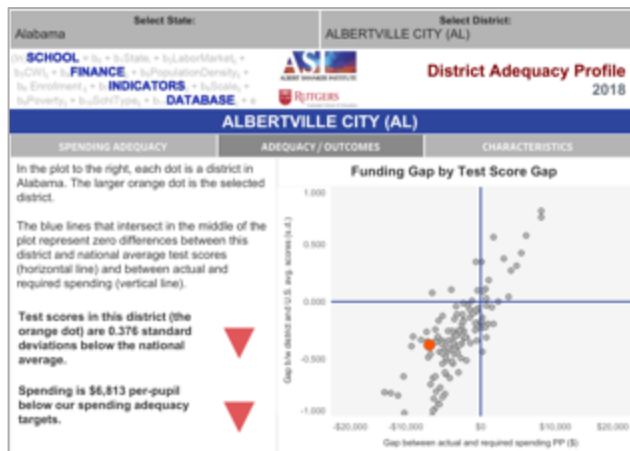

# Resources: one-page state profiles

The profiles summarize, visualize, and describe in clear language the key results for each state (and D.C.)

- Focus on the “core indicators” of effort, adequacy, and progressivity
- Comparisons with U.S. averages
- Trends over time
- Updated annually with latest data

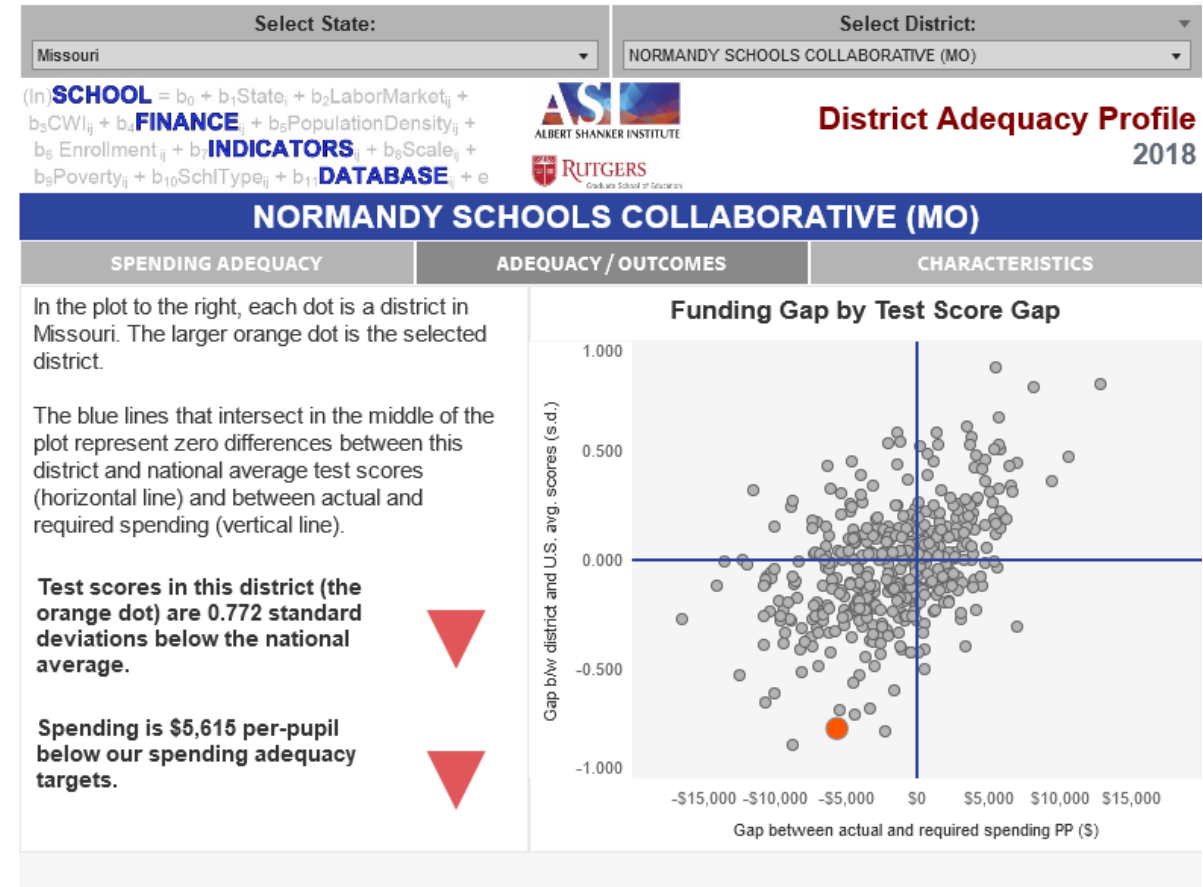

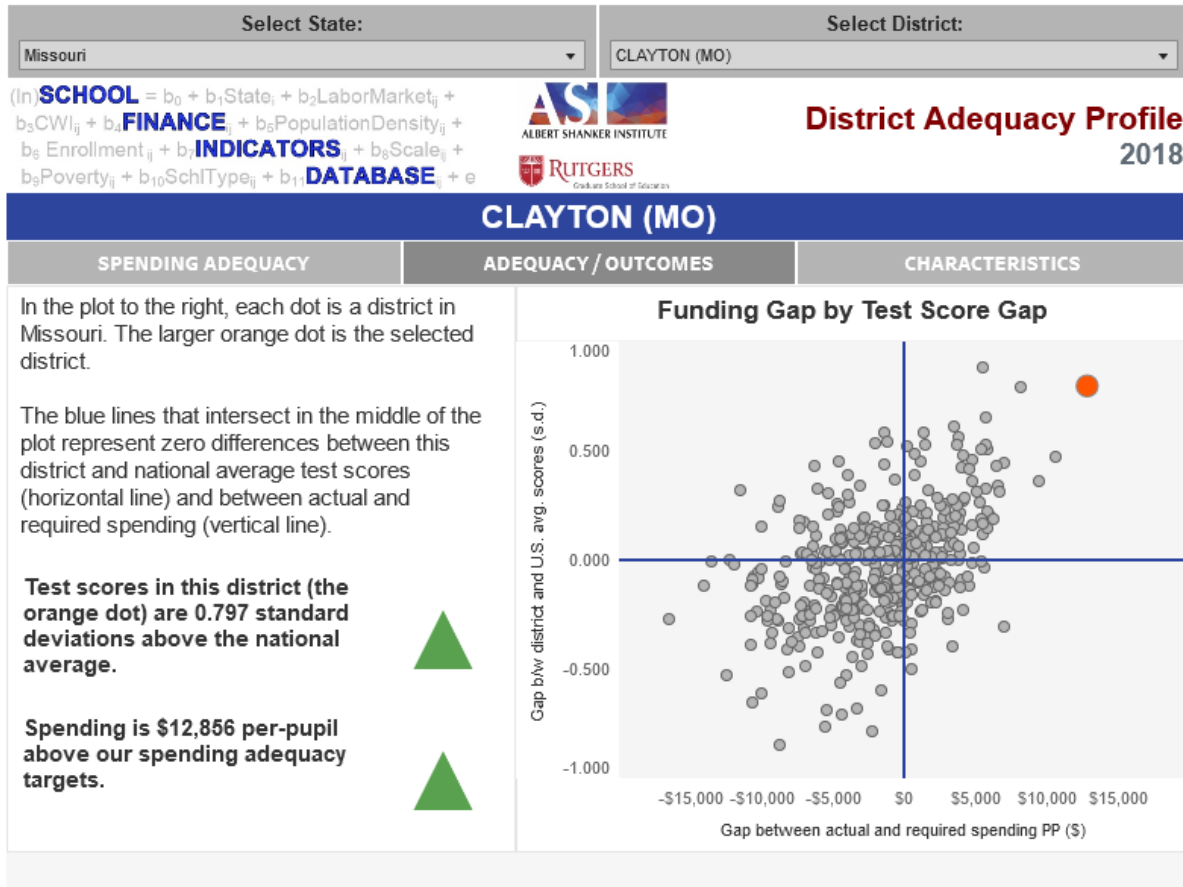

# Resources: online data visualizations

Visualize the latest results for a state or district on a group of selected measures (including the three “core indicators”).

# Resources: visualization example

District adequacy profiles for two Missouri districts

# Awesome data sets to use in combination

- School Finance Indicators Database (1993-2019, state & district level)
  - <https://www.schoolfinancedata.org/download-data/>
- Correlates of State Policy (through 2016, state level)
  - <http://ippsr.msu.edu/public-policy/correlates-state-policy>
- Stanford Education Data Archive (2009 to 2018, state, county district)
  - <https://purl.stanford.edu/db586ns4974>
- HOLC Redlining Maps (1939)
  - <https://dsl.richmond.edu/panorama/redlining/>

# Summing it all up!

Where we are at  
Where we need to go  
Your role in it all!

# Summing it all up

- Money matters
  - Increasing funding helps, cutting funding hurts!
  - Cuts usually hit low income and minority students first and worst!
  - It costs more to achieve higher standards than lower ones!
- Race is the underlying cause, not just some incidental correlate, of many (if not most) disparities in school funding both within and between states
- A major stepped up federal effort is required for improving equal educational opportunity for all US children, and mitigating racial gaps
  - Only federal dollars, coupled with federal regulatory pressure can mitigate gaps between states
- Problems created on the basis of race require solutions explicitly based on race

# Coming together & raising the bar

- There are very few school finance “experts” out there
  - Share your knowledge & expertise
- There are unifying frameworks to guide our field
- There are better and worse, right and wrong ways to evaluate school finance systems
  - Put bluntly – some methods produce more valid results than others
  - Our approaches to designing, reforming and informing state school finance systems should... **MUST!** be guided by something!
    - The ***Who?*** and ***How Much?*** questions asked by Berne & Stiefel back in day can be guided by relevant methods, leading to empirical answers (or at least reasonable estimates)
- A lot of great stuff, amazing ideas, came long before us!
  - Dig deep in school finance literature to inform your own ideas!

# Brilliant stuff from our distant past

- First to conceptualize (as far as I can tell) cost modeling to estimate differences in costs to close outcome gaps in relation to student needs?
  - Garms, W. I., & Smith, M. C. **(1970)**. Educational need and its application to state school finance. *Journal of Human Resources*, 304-317.
  - First in modern wave:
    - Downes, T. A., & Pogue, T. F. (1994). Adjusting school aid formulas for the higher cost of educating disadvantaged students. *National Tax Journal*, 47(1), 89-110.
- Clever policy solutions to diversify (& stabilize) revenues
  - Ladd, H. F. (1976). State-wide taxation of commercial and industrial property for education. *National Tax Journal*, 29(2), 143-153.

# Brilliant stuff from our distant (and not-so distant) past

- Basis for my unified conceptual/empirical framework here?
  - Duncombe, W., & Yinger, J. (1999). Performance standards and educational cost indexes: you can't have one without the other. *Equity and adequacy in education finance: Issues and perspectives*, 260, 261.
- Basis for my argument for conditional modeling of spending variation?
  - Berne, R., & Stiefel, L. (1979). Concepts of equity and their relationship to state school finance plans. *Journal of Education Finance*, 5(2), 109-132.
  - Berne, R., & Stiefel, L. (1994). Measuring equity at the school level: The finance perspective. *Educational Evaluation and Policy Analysis*, 16(4), 405-421.

# Don't

- Just take weighted averages of spending on the child from a low income family compared to child from non-low income family
  - Within, or between districts
  - Same for race
  - Comparing spending or revenue variation on any one dimension requires accounting for the other dimensions!
- Similarly, don't just take average spending of high and low poverty schools or districts
  - Same for race
- Compare total district revenues to charter school revenues in fiscal dependent models
  - Even if you subtract pass-throughs and students they go to, districts often pay for services that are rendered to or associated with fiscally dependent charters:
    - Special Education, transportation, enrollment management

# Do...

- use funding adequacy measures as covariates instead of less completely adjusted spending measures...

	Dependent Variable	
	Pct. Of Time In Virtual Instruction	
	Spending Model	NECM Adequacy Gap/Surplus Model
Spending per pupil (\$10,000s)	0.028*** ( 0.006)	-
NEMC Adequacy Gap/Surplus per pupil (\$10,000s)	-	-0.061*** ( 0.005)
Enrollment (natural log)	0.048*** ( 0.002)	-
ELL Pct.	0.283*** ( 0.028)	-
IEP pct.	-0.112** ( 0.056)	-
SAIPE Poverty pct.	0.490*** ( 0.029)	-
Constant	-0.230*** ( 0.037)	0.347*** ( 0.029)
N	6655	6823
R-sq.	0.573	0.503

Regression Results: Correlation of Fiscal Measures with Percentage of Student Time in Virtual Instruction

# A few additional thoughts

- Don't be obtuse in describing empirical findings! (and don't accept "obtusity" as a reviewer) especially those with policy relevance
  - Just say it: Older white populations choose to spend less on schools attended by Black and brown children (find the blunt, clear way to summarize your findings).
- Be willing to distinguish between statistical causation and real world causes (which is the basis of "legal causation")
  - Sure, statistical modeling can show that there exists an association between redlined locations/spaces in 1939 and school funding gaps in 2018... but... OMG... Correlation isn't causation!?
  - The reality is that those HOLC maps (and FHA practices) did in fact CAUSE racial disparities in housing values and in turn, in wealth – including the taxable value of those homes decades later – which CAUSES modern day school funding disparities
    - The correlation reveals the presence of an underlying causal mechanism/process, at least in this case.
    - While your models might not "prove causation," history might!

# Examples from Other States

# Maryland Kirwan/Blueprint

***Kirwan/Blueprint spending targets, which are based largely on input oriented analysis, overstate costs and needs in affluent suburbs (Howard County) but understate costs of equal opportunity in Baltimore City.***

# Illinois “Evidence Based” Model

Illinois’ new “Evidence Based” school funding model substantially understates the additional costs of providing equal opportunity in high need settings, setting a spending bar for the City of Chicago that is only marginally higher than that of its most affluent suburban neighbors.

EB Model “effective” weight on % Free or Reduced = .273

# Alternative Cost Model Estimates

## Vermont & Connecticut

Vermont Weights Model  
UVM & AIR 2018

Connecticut Cost Model  
Zhao & Chiumenti FRB of Boston

Cost modeling on Connecticut schools by authors from the Federal Reserve of Boston produce similarly strong adjustment for poverty as our own models in Vermont and New Hampshire

# Kansas

Figure 1. Comparing Estimated Costs From Two Kansas Cost Studies

***Cost model results by two separate authors, 12 years apart, produced similar cost predictions for Kansas public school districts.***

# Kansas profile

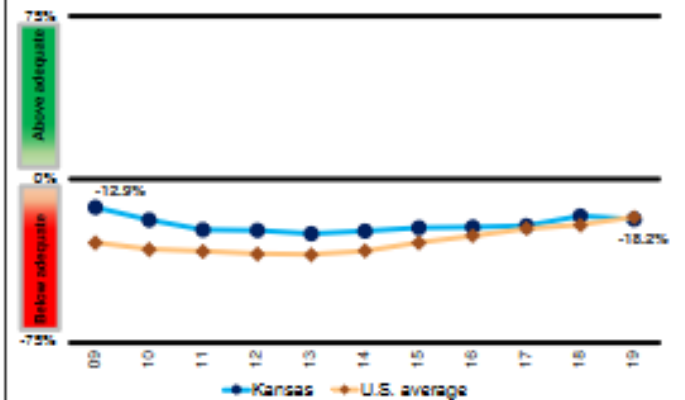

## ADEQUACY

**Adequacy** compares actual per-pupil (PP) spending in each state to cost model estimates of the amount required to achieve U.S. average test scores. These comparisons (% difference) are presented for 2019, by district poverty quintile, in the center graph (the gold diamonds represent U.S. averages).

- Resources in KS's highest poverty districts are **below adequate**.
- Spending in these districts is \$2,669 PP **lower** than the adequacy target (\$14,640), a difference of -18.2%.
- This ranks #24 in the U.S. (out of 49).
- Across the entire state, 29.9% of KS students attend districts with spending below estimated adequate levels.

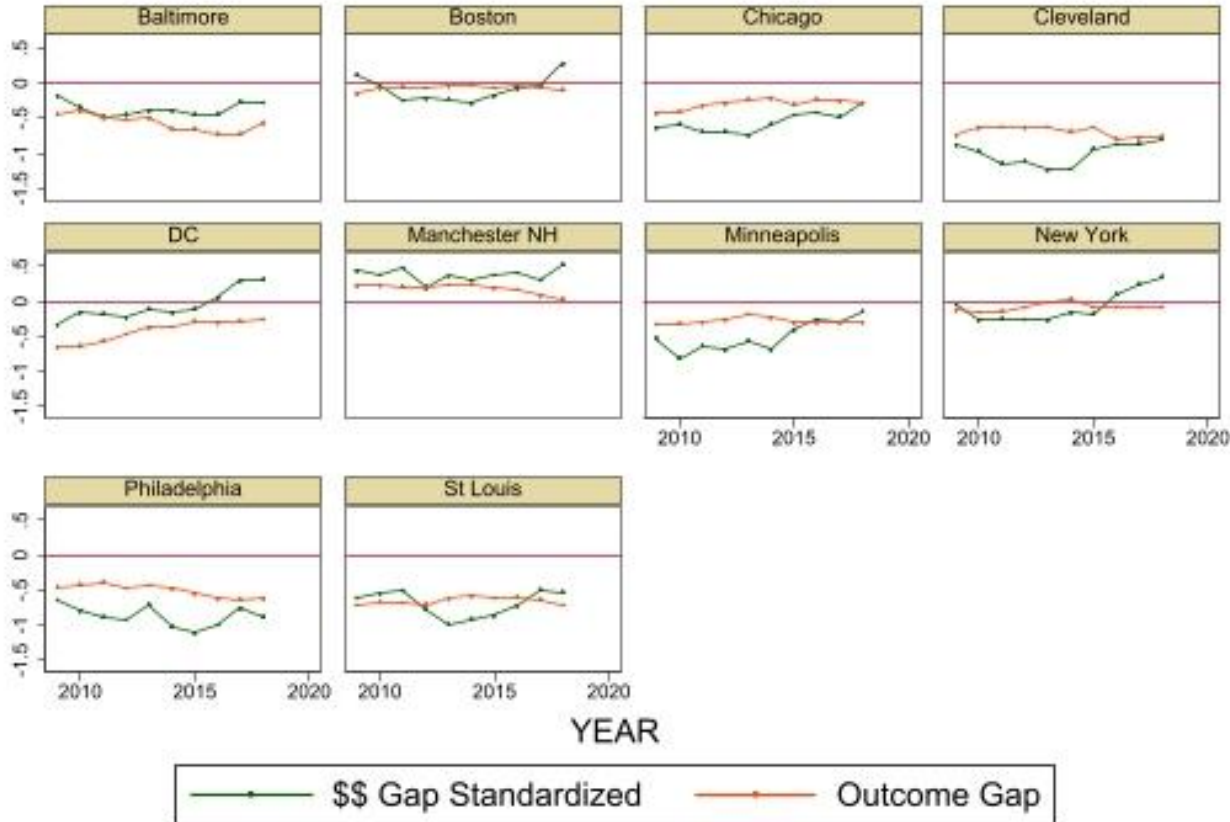

### Adequacy trend (pov. Q5), 2009-19

- Adequacy in KS's highest-poverty districts **worsened** between 2009 (-12.9%) and 2019 (-18.2%).
- During this period, U.S. average adequacy in these districts (orange line) improved from -29.1% to -17.3%.

Regarding funding adequacy, Kansas has done better than many other states including Tennessee, due in part to a combination of judicial pressure, empirical evidence and legislative responsiveness.

# Adequacy and Outcomes in Select Cities

Cities with more adequate funding tend to have higher outcomes and cities where funding adequacy has improved over time have seen improved outcomes.

Note: NYC outcome data unavailable after 2015

Graphs by city

# Adequacy and Outcomes in Select Cities

Cities with more adequate funding tend to have higher outcomes.

Note: NYC outcome data unavailable after 2015 (outcome gap based on 2015 data)
